Hiring Team, Opalus Investments Limited

OPAL Engineering — Kochi, Kerala

Re: Senior Java Developer — OPAL Platform

Dear Hiring Team,

I am applying for the Senior Java Developer role on OPAL. I have spent close to six years building production software, five on backend systems, and the last two leading engineering on two live platforms as their sole or lead backend developer. I am based in Ernakulam.

At Hotelo I built the entire backend from scratch for a hiring platform now past **50,000 registrations** across iOS and Android — a versioned REST API secured with JWT, role and permission based admin access, PostgreSQL with PostGIS, Redis and queued workers, and a candidate search that ranks twenty filter dimensions through a weighted relevance score computed in SQL. At CAAPID Simplified I own the commerce stack: Stripe subscriptions, EMI instalment plans, coupon and pricing rules, idempotent webhook handling and reconciliation of payment state against internal records. That is ledger discipline applied to revenue people actually pay. I have also administered and integrated ERPNext, so chart-of-accounts thinking and document workflows are familiar ground.

I am looking to make Java my core language, and this is the role I would want to do it in. My degree work was in Java, and the patterns Spring formalises — dependency injection, ORM and entity mapping, schema ownership and migrations, queue consumers, JWT and OAuth 2.0 — are ones I already work in daily on another stack. I am working through Java 17 and Spring Boot now, and would happily take a Java exercise as part of your process.

I would value the conversation. Thank you for your time.

Sincerely,

Vishnu P S
